**Abstract:** *In this study, the basic operating principles of participation banks, which have been operating in our country for more than thirty years and have been increasing their market share day by day, their fundamental and procedural differences from other banks, and the system that constitutes the investment processes of institutional and individual investors who cannot or do not want to utilise their savings in banking and capital market products and instruments due to interest sensitivity have been reviewed.*

**Key words:** participation banking; interest-free investment; Türkiye

**JEL Classification Codes:** G21, G41

### 1. INTRODUCTION

Participation banks were established as Private Finance Institutions and have an significant impact on the Turkish Banking System (see App-1, App-2; <https://www.tbb.org.tr>) in Turkey. These institutions, which were included within the scope of the Banking Law in 1999, were fully included in the Banking Law in 2005, were subject to the same legislation as deposit and investment banks, and were called Participation Banks (Tunç, 2010).

Including the participation banks established with public capital, Ziraat Participation Bank, Vakıf Participation Bank and Emlak Participation Bank, which have started their operations in Turkey, the current number of active participation banks is six. These are: Kuveyt Türk Participation Bank, Vakıf Participation Bank, Albaraka Türk Participation Bank, Emlak Participation Bank, Ziraat Participation Bank and Türkiye Finans Participation Bank. According to the information in June 2022; Kuveyt Türk Participation Bank; with 449 branches and 6092 personnel, Albaraka Türk Participation Bank; with 226 branches and 2645 personnel, Vakıf Participation Bank; with 141 branches and 2010 personnel, Emlak Participation Bank; with 77 branches and 1141 personnel, Ziraat Participation Bank; with 135 branches and 1784 personnel, Türkiye Finans Participation Bank; it continues its activities with 316 branches and 3527 personnel (<https://www.tbb.org.tr>)

### 2. DIFFERENCES OF PARTICIPATION BANKS FROM INTEREST-BASED BANKS

After Participation Banking started to operate in our country, bank depositors' differences from other banks (conventional banks) began to be a matter of discussion. Although they are similar to each other in terms of fund collection and disbursement methods, the transactions fundamentally differ from each other in terms of procedures and principles. Although at the

This is an open-access article distributed under the Creative Commons Attribution-NonCommercial 4.0 International License (<http://creativecommons.org/licenses/by-nc/4.0/>).

beginning of the establishment process, the public was distant from participation banking because they did not have detailed information about the system and the structures were similar, over time the system became widespread, advertisements increased, etc. For these reasons, information about the subject was obtained. The fact that participation banks established with public capital in recent years have also started their activities and are growing rapidly has strengthened confidence in the subject and awareness of the principles applied in transactions has increased. The main difference between the two organizations is that participation banks collect or provide funds based on the profit-loss sharing principle. (Ozulucan & Deran, 2019).

Current accounts, current deposit accounts, that is, current accounts, which are the most used products by bank depositors, are applied in the same way in both types of banking. However, in the use of deposit accounts, conventional banks; These are account types that bind money at a certain rate and maturity and inform the depositors or customers precisely and absolutely how much interest income they will receive on which day. In the fund disbursement section, they add a certain percentage of interest to the time deposits they have made from their customers. The general principle in participation banking is profit-loss sharing. The organization purchases a product or service to be purchased by its customer in cash with its own capital or customer deposits and sells it to the customer on a deferred basis. Or, in principle, it is a situation where the bank rents a product it has purchased for itself to its customer.

The most fundamental point and difference in these transactions is that there is definitely a product or service in participation banks where funds will be provided or funds will be transferred. Cash funding cannot be provided to customers. Payment is made only to the seller in exchange for a product or service to be purchased. Conventional banks generally transfer loans and funds to customer accounts in cash, in line with their customers' needs.

The reason why participation banks and other (conventional) banks have similar fund collection and disbursement rates is that they carry out transactions in the same market with the same maturities. While it is possible for conventional banks to make a certain amount of profit from the transactions they carry out by considering a certain profitability rate based on policy interest rates, they can also generate income from interest-bearing items from the central bank's interest rates and transactions such as repo and reverse repo. However, participation banks cannot generate any income if they cannot use the funds they collect. By collecting funds around the prices established in the market and taking into account certain customer profits and corporate profitability, they repay the products they purchase in advance while selling them. For this reason, there are not many price differences in the market. For example, if a conventional institution provides commercial loans with a 12-month maturity at a rate of 1.20, and participation banks provide funding with a lower rate, the profit it will distribute to its depositors will be low, and one of the reasons for preference will be weakened. Conversely, when the participation bank sets a higher price, it will be able to transfer more profitability to the depositors from whom it collects funds, but this situation will not be sustainable as its customers may prefer conventional banks with lower rates in their financing transactions due to the difference in the market.

### **3. FUND COLLECTION METHODS IN PARTICIPATION BANKS**

#### **3.1. Special Current Accounts**

Current accounts are defined in Article 3 of the Banking Law, they are current accounts opened in participation banks, which can be accessed at any time, which can be withdrawn from the account in whole or in part, and which consist of funds to which no income or dividends are accrued to the account depositor. These are accounts that can be opened in Turkish Lira, foreign

currency or precious metals such as gold and silver, and from which the deposits can be withdrawn partially or completely whenever there is a demand.

(<https://www.mevzuat.gov.tr/mevzuatmetin/1.5.5411.pdf>)

### 3.2. Participation-Participation Accounts (Participation in Loss and Profit)

It is a type of deposit account available in Participation Banks. It is the type of account where the deposits deposited into the relevant account are paid to their accounts with a joint profit and loss output as a result of the relevant maturity. In return, no specific or definitive output can be specified to account holders and depositors, and even the principal cannot be guaranteed. It can share in the profit and loss according to its segment in the participation pool and bring profit and loss according to its proportion in the pool it is in. It can be opened with Turkish Lira, Dollar, Euro and Gold. Since silver-based disbursement is also made in some participation banks, silver participation accounts can also be found. It can be opened with various maturity options (such as 1 month, 3 and 6 months).

The capitalist with surplus funds brings the excess funds to the participation bank in anticipation of profit returns. The organization uses the relevant fund to purchase goods or services for its customers who request funds and are interested in real trade. Profit and loss from the relevant transaction are reflected in the customer's forward account as positive or negative at the end of the relevant maturity. (Aktepe, 2012). Participation accounts, with the logic and operation mentioned above, provide the participants with the opportunity to earn interest-free returns in accordance with participation banking principles. Deposited savings and fund surpluses are realized by sharing the profits obtained through interest-free principles and contracts. Income tax is automatically deducted from the profits generated in the relevant accounts at the end of maturity. Banks act as civil servants on behalf of the public in carrying out this transaction. Amounts up to 950,000 Turkish Liras in participation accounts, like current accounts, are covered by the Savings Deposit Insurance Fund guarantee as of 2025 ([https://www.tmsf.org.tr/assets/docs/Sigorta\\_Kapsami.pdf](https://www.tmsf.org.tr/assets/docs/Sigorta_Kapsami.pdf))

## 4. CONCLUSION

The main reason why people prefer Participation Banks is interest sensitivity. The target audience of the sector, which is growing and getting stronger day by day, is the individuals or institutions that carry out most banking transactions. The fact that the system works with a buying and selling method and a rental system also instills confidence in its customers who are not depositors due to interest sensitivity. As a matter of fact, in the past crises experienced in Turkey, during periods when interest rates rose overnight, there was no change in the debts of the participation banks' customers and the system survived in some way, thus attracting the attention of all kinds of customers, especially in debt-related transactions, and allowing them to make transactions safely.

Participation Banks have played the most important role in bringing the savings and savings of investors, who stay away from conventional banks and interest-bearing investment instruments for religious reasons, into the economy. Individuals or institutions that do not prefer to invest their savings and savings through banks due to interest sensitivity benefit from the products and services provided by participation banks. The fact that they operate not only in forward account transactions but also in precious metal transactions and that they have funds managed by portfolio investment institutions and professional expert teams is important for individuals and institutions who do not have the time and knowledge to direct their own investments. As the relevant funds and market shares grow day by day, it makes the system stronger and more accessible. Participation Banks, whose market share is growing and their

profitability increasing, are increasing their number of branches and personnel, investing in their technological infrastructure, and opening new subsidiaries such as investment portfolio companies.

The fact that the participation index is calculated in Borsa Istanbul, that participation banks that mediate stock transactions provide this service to their customers and depositors through their investment accounts, and that they only mediate the purchase and sale of filtered stocks that meet the relevant criteria, reduces the operational burden of investors compared to other brokerage firms.

In order for investors who want to increase or at least protect their savings and to eliminate the risks arising from the obligations of storing physical money and precious metals, to evaluate their investments interest-free, products and services are provided in most of the capital market instruments and the number of products and services is increasing day by day.

Although the system has become or is becoming automated with the development of technology over time, the personnel selection of Participation Banks should consist of trained personnel who act in accordance with the relevant sensitivity and know the system well. When the transactions are followed up exactly by the personnel, the full fulfillment of the relevant contractual provisions must be monitored. This is a requirement of the belonging of investors to the system, who entrust their savings to the relevant institutions due to their sensitivity.
